The Mac version of Photoshop now spits images out to the Web in the Creative Cloud apps, using the browser, which is pretty neat. (This feature might have changed by the time you read this, though.) There's also the additional benefit of being able to edit a photo offline, if that's your thing. App Store versions of Photoshop CC all run a browser-based editor right on your iPad or iPhone, but you need an Internet connection to view the browser window. A desktop version of Photoshop is available, too. There are new features and "big-ish" updates, in the words of Adobe's marketing department. These mostly affect CC's Behance integration, the Assets panel, and performance. It now offers a new multi-select tool that lets you take a snapshot of a whole layer and then drag-select the areas you want to edit. There's an improved clipping mask option to make easier the removal of one layer from another. New adjustments are available for red-eye reduction, image sharpening, and image editing with the addition of a Lens Correction tab. The new Locks feature, which was originally introduced in Photoshop Express, lets you lock individual layers in any of the available modes. Locking features allow you to keep an image or module/layer in one version while working on another, providing you don't overwrite the original with your trial version. Again, not much has changed in Photoshop. The draw-in-place option for moving a layer over another that has background art with it and introducing in-layer masking is handy. But there's not a lot more to talk about, except for one notable inclusion: the ability to print with drag-and-drop in Photoshop.
